

Wild bees

In the UK we have around **270 species** of...

Bumblebees and solitary bees are wild bees, and they are the heroes of the pollinator world.

Here are **10 wild bee** species you may have spotted buzzing around.

Bumblebees

There are **24 species** of bumblebee in the UK

- Queen bumblebees are amongst the earliest pollinators to emerge in spring.

Solitary bees

There are over **200 species** of solitary bee in the UK

- There are around 70 species of mining bee (*Andrena*), five flower bees (*Anthophora*) and around 40 species of sweat bees (*Halicitus* & *Lasioglossum*).
- Solitary bees do not have a queen or live in a hive. They live alone in nests underground, inside plant stems, in deadwood or even in old snail shells!

Bee facts

Various bees, hoverflies, beetles, wasps, butterflies and moths pollinate wildflowers and we rely on them for every third mouthful of food we eat. Solitary bees are the most effective bee pollinators because they are messier, using a brush instead of a basket, to collect pollen. Without bees, we would be unable to grow lots of our favourite foods, including tomatoes and blueberries.

Bee decline

The use of insecticides and herbicides have been linked to declining bee numbers. Wildflower meadows are a great source of nectar-rich food for many bee species but 97% of these have been lost in England and Wales since World War II.

How can we help bees?

Feed wild bees with wildflowers like daisies and clover that are rich in pollen and nectar by leaving lawns uncut for the spring and summer to create a mini meadow.

Add a shallow water dish with pebbles or create a mini wildlife pond so bees can take a drink.

Give them somewhere to nest with a bee brick or by making them a bee home.
